CPC3981Z
800V, 45Ω N-Channel Depletion-Mode MOSFET

$V_{(BR)DSX}$	$R_{DS(on)}$	I_{DSS}	Package
800V	45Ω	100mA	SOT-223-2L

Features
- High Breakdown Voltage: 800V
- Low On-Resistance: 45Ω max.
- Low $V_{GS(off)}$: -1.4V to -3.1V
- High Input Impedance
- Small Package Size: SOT-223-2L

Applications
- Normally-On Switches
- Solid State Relays
- Converters
- Telecommunications
- Power Supply
- Current Regulators

Description
The CPC3981Z is an 800V, N-channel, depletion-mode, Field Effect Transistor (FET) in a modified SOT-223 package to provide greater separation of the drain and source leads for high voltage applications.

Fabricated using Littelfuse Integrated Circuits' proprietary vertical DMOS process yields a robust MOSFET device with high input impedance and high voltage performance.

The CPC3981Z's highly reliable MOSFET has been used extensively in Littelfuse Integrated Circuits's Solid State Relays in power, industrial, and telecommunications applications.

The CPC3981Z is available in the SOT-223-2L package.

Absolute Maximum Ratings @ 25ºC

Parameter	Ratings	Units
Drain-to-Source Voltage	800	V
Gate-to-Source Voltage	±15	V
Pulsed Drain Current	150	mA
Total Package Dissipation [1]	1.8	W
Operational Temperature	-55 to +125	ºC
Junction Temperature, Maximum	+125	ºC
Storage Temperature	-55 to +125	ºC

[1] Mounted on 1"x1" 2 oz. Copper FR4 board.

Absolute Maximum Ratings are stress ratings. Stresses in excess of these ratings can cause permanent damage to the device. Functional operation of the device at conditions beyond those indicated in the operational sections of this data sheet is not implied.

Typical values are characteristic of the device at +25°C, and are the result of engineering evaluations. They are provided for information purposes only, and are not part of the manufacturing testing requirements.

Manufacturing Information

Moisture Sensitivity

All plastic encapsulated semiconductor packages are susceptible to moisture ingression. Littelfuse Integrated Circuits classifies its plastic encapsulated devices for moisture sensitivity according to the latest version of the joint industry standard, **IPC/JEDEC J-STD-020**, in force at the time of product evaluation. We test all of our products to the maximum conditions set forth in the standard, and guarantee proper operation of our devices when handled according to the limitations and information in that standard as well as to any limitations set forth in the information or standards referenced below.

Failure to adhere to the warnings or limitations as established by the listed specifications could result in reduced product performance, reduction of operable life, and/or reduction of overall reliability.

This product carries a **Moisture Sensitivity Level (MSL)** classification as shown below, and should be handled according to the requirements of the latest version of the joint industry standard **IPC/JEDEC J-STD-033**.

Device	Moisture Sensitivity Level (MSL) Classification
CPC3981Z	MSL 3

ESD Sensitivity

This product is ESD Sensitive, and should be handled according to the industry standard **JESD-625**.

Soldering Profile

Provided in the table below is the **IPC/JEDEC J-STD-020** Classification Temperature (T_C) and the maximum total dwell time (t_P) in all reflow processes that the body temperature of these surface mount devices may be (T_C - 5)°C or greater. The device's body temperature must not exceed the Classification Temperature at any time during reflow soldering processes.

Device	Classification Temperature (T_c)	Dwell Time (t_P)	Max Reflow Cycles
CPC3981Z	260°C	30 seconds	3

Board Wash

Littelfuse Integrated Circuits recommends the use of no-clean flux formulations. Board washing to reduce or remove flux residue following the solder reflow process is acceptable provided proper precautions are taken to prevent damage to the device. These precautions include but are not limited to: using a low pressure wash and providing a follow up bake cycle sufficient to remove any moisture trapped within the device due to the washing process. Due to the variability of the wash parameters used to clean the board, determination of the bake temperature and duration necessary to remove the moisture trapped within the package is the responsibility of the user (assembler). Cleaning or drying methods that employ ultrasonic energy may damage the device and should not be used. Additionally, the device must not be exposed to halide flux or solvents.
